

Another week, another 57 Americans reported dead to VAERS (v64 last week) amongst 1,841 adverse events (v 1,691 last week)

Peter Halligan
Mar 3

From [here](#) and [here](#) there were 57 deaths amongst 1,841 adverse events (US only) reported for the week ended 24 February 2023. This lifts the cumulative number of US deaths reported to VAERS to 17,024 and the number of adverse events to 940,017.

Total reports to VAERS from all round the world (including the US) for doses made by US companies reporting to the FDA/CDC, were for another 98 deaths amongst 2,889 adverse events for the week, lifting cumulative reports of death to 34,576 amongst 1,527,371 adverse events.

The latest update for deaths and injuries reported to the European adverse events reporting system maintained by the EMA, EUDRA, to 25 February 2023 is here:

[50,663 DEAD and 5,315,063 Injured Following COVID-19 Vaccines in European Database of Adverse Reactions - Vaccine Impact](#)

For the US only, assuming an Under-Reporting Factor (URF) of 40, this would represent 680,960 deaths amongst 37.6 million adverse events. Globally, deaths for companies subject to CDC/FDA reporting to the US VAERS would be 1,383,040 amongst adverse events of 61.1 million injuries.

672 million doses have been administered [in the US](#) and 13.32 billion doses [globally](#).

Note that 70% of the world's 8 billion people have now received at least one dose. This works out an average of 2.4 doses each for the 5.6 billion that have received at least one dose.

The casualties reported to the US - adjusted for a URF of 40 - is not an estimate of deaths and injuries globally from C19 injections of all sorts (e.g. viral vector or mRNA injections) just the casualties from companies reporting in to the US VAERS regulated by the CDC/FDA (mostly Pfizer BioNTech, Moderna, Novavax and JnJ).

The US VAERS plus EU EUDRA numbers can be multiplied by around 6-8 to "globalize" estimated deaths and injuries and then multiplied by 40 to adjust for the URF.

India mostly uses viral vector injections ([EUDRA shows these to be even more deadly than mRNA](#)). China does not publish adverse event data – but I doubt that it would be backward in coming forward if China’s vaccines were more effective and safer than either viral vector or mRNA injections. [India and China](#) are far the biggest “injectors” of C19 vaccines with 5.6 billion doses administered between them out of 13.32 billion doses administered in total globally.

Coronavirus (COVID-19) Vaccinations - Our World in Data

From [here](#), the number of US doses administered increased by 0.5 million (down another 0.1 million)

For

leaving 293 million unused. The percentage of unused doses out of those shipped remained at a whopping 30%.

The vast majority of these 293 million doses are obsolete and either past or approaching their “use by” dates. The US had ordered around 1.22 billion a few months ago, so there is, potentially, at least another quarter billion doses on the way, presumably NOT for the old monovalent doses, but all for the new and disproved bivalent doses.

Dominant variants according to the CDC are here:

CDC COVID Data Tracker: Variant Proportions

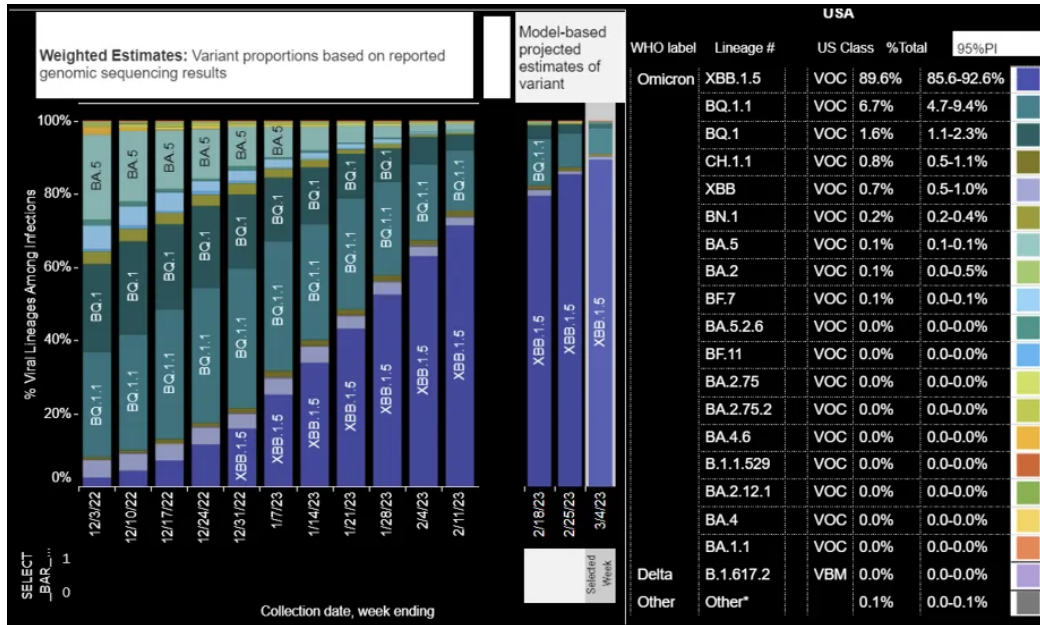

million were bivalent doses,

nber of unused doses (disposed of
st week) almost all of which are

672 million doses administered,,

Note the bivalent C19 mRNA injections target the original and BA4/BA5 variants that no longer exist.

We should be seeing stories of the destruction (via highly specialized incinerators) of around 250 million doses in the US shortly, if they have not been disposed of already. (20 bucks each = the odd 5 billion bucks up in smoke). This same phenomenon applies globally – mass destruction of obsolete doses. We saw stories a few weeks ago that other devices are past their “use by” dates when Germany announced its intentions to destroy 800 million stale masks. Australia also announced that it would be destroying 27 million of its obsolete doses for its population of 26 million.

From here, Europe has 458 million unused doses (down!!) 1 million since the last update. The US plus EU alone have almost three quarters of a billion unused doses (749 million).

Assuming the US + EU represents 25% of the global C19 mRNA market by population, there could be a whopping 4 billion doses in freezers elsewhere that need to be incinerated – if they have not been already.

Onwards!

&c. Mar 4

it's a comfort to know that all toxic overstocked produce will be disposed of safely & effectively & not leach into the water tables & aquifers & subsequently into animals & insects & the food chain or wind up in the wind blowing everywhere especially my lungs.
