

Covid Vaccine mRNA In Breast Milk Shows CDC Lied About Safety

US government lacked scientific evidence before recommending mRNA vaccines to pregnant and breastfeeding women :: Facebook censored those sharing accurate information

It is safe for pregnant and breastfeeding women to get vaccinated against Covid-19, according to the Centers for Disease Control. In fact, [according to the CDC](#), vaccination during pregnancy benefits the baby, and “reports have shown that breastfeeding people who have received mRNA COVID-19 vaccines have

antibodies in their breastmilk, which could help protect their babies.”

The CDC wasn't alone. The American College of Obstetrics and Gynecology repeatedly [urged](#) [pregnant](#) and [breastfeeding](#) women to get vaccinated.

There was no reason to worry, experts said, because injected mRNA stays in the arm and does not travel around the body. “It is unlikely that the vaccine lipid would enter the bloodstream and reach breast tissue,” the Academy of Breastfeeding Medicine assured mothers in [a statement](#) on December 14, 2020. “If it does, it is even less likely that either the intact nanoparticle or mRNA transfer into milk.”

But now a pivotal new study, published yesterday, reveals that this was always a lie.

Mandatory Vaccines, Inadequate Data
